

Calming Bottle IMFs

Name: _____ Date: ____/____/____ Pd: _____

Pre-lab: Draw the Lewis Structures below:

Acetone (CH_3COCH_3)	Water (H_2O)	Sodium Chloride (NaCl)

Part 1: In 4 Erlenmeyer flasks, observe the following in the front of the room.

What did you notice? Compare the two pairs of like variables (yellow vs blue, acetone vs water). What conclusions can be drawn about IMFs present?

Part 2: Create a solution of the most vivid yellow solvent into a small flask. Pour about 20 mL into your flask. Add 30 ml of the most vivid blue solvent on top (this mixture has been made for you). Pour gently so as to not mix the solvents.

Draw what you observe:	Why is this happening? Is this effect due to IMF difference or density?

Now put a stopper in your test tube and shake the contents vigorously. Then put it back in your test tube rack and let it stand for a moment.

What happened after the mixture was agitated? Why is this the case? Justify your answer using intermolecular forces.

Part 3: Weight 7 g of NaCl and add it to the test tube. Stopper the test tube and shake vigorously, until you see that the salt is starting to dissolve. Then put it back in your test tube rack and let it stand for a moment.

Draw what you observe:	Why is this happening? Discuss in terms of IMFs

Rank the intermolecular forces you observed in today's lab below from weakest to strongest. Justify your ranking.
