

Day 17, October 2 & 3, Unit 1.5

AGENDA

1. Turn in Ch. 10 Reading Guide
2. Feedback for Gender Doll Project
3. HDI Research and Theory Application Activity
 - a. Independent Work
 - b. Due beginning of next class!

General Gender Doll Feedback

1. Cease your vagueness

- a. "Things" "Stuff" "Stuff like that" "Everything" and They/They
- b. Differences & Similarities - don't use one sentence to combine reasons for similarities and differences; separate sentences to prevent confusion
- c. Higher or lower, Better or worse GDI or GII
 - i. Instead, state "Country A has more gender inequality/equality than Country B." Give the numbers meaning. This adds necessary value added analysis. Anyone can read the numbers but I a student scholar will explain what they mean.
- d. "They have similar GIIs or GDIs but the numbers are close." Context matters.
 - i. When numeric range for all scores is small, don't overstate similarity.
 1. GDI: 0-1.1 range;
 2. GII: 0 - .9

2. Comparing GDI data: focus on comparing gender gaps in each country as that is the entire point of the index.

3. Capitalization: First letter of sentence, country names

4. Spelling: Countries not "countrys"

5. Punctuation: periods go at the end of a sentence

6. Secondary Schooling = High School

7. Which measure GDI or GII gives us a better understanding: Must address fully by referencing both measures.

Think Critically about what data can and cannot measure.

- a. Could GNI per capita be lower for women if their labor force participation is lower than males?
- b. How helpful is life expectancy when, regardless of a country's level or development or overall GDI score, females tend to almost always live longer than males.
- c. GDI and GII are quite different in terms of gender equality: Is GDI giving too much weight to life expectancy and years of schooling and masking GNI per capita disparities? Or is GII giving too much weight to female reproductive health and teen pregnancies?
- d. GII: Claiming GII is a less informative score because they don't measure paternal mortality rates and male teen births is a logical fallacy. Why would GII have these measures included? What insight does it provide?
- e. Expected Years of Schooling does not directly reflect the "expectations" of any group. It refers to the number of years of schooling that is expected based on age specific enrollment rates at the time of school entrance for an age cohort. Basically, that means how much schooling is the student expected to receive based on what older students are currently completing.
- f. Low labor force participation in both genders: Could it be related to the fact some countries have less teens and elderly working? Overall Eco./Soc. Development?
- g. Labor Participation: Since women are often more likely leave workforce to care for infants, elderly for periods of time, could this number not consider the fact that women are working just not all the time.
- h. Reasons for similarities / Differences: Reason for similar/different gender gap; not differences is overall development of country; go deeper

Theory Review

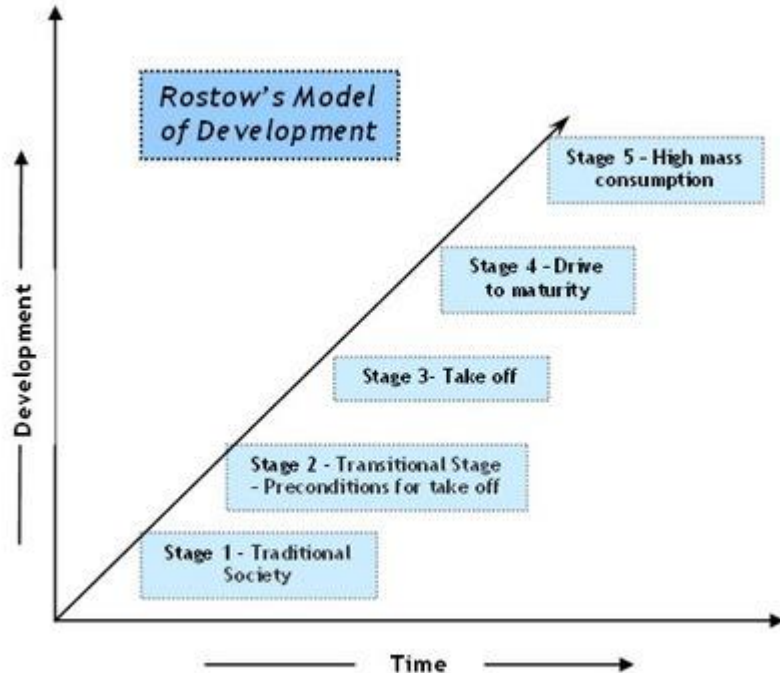

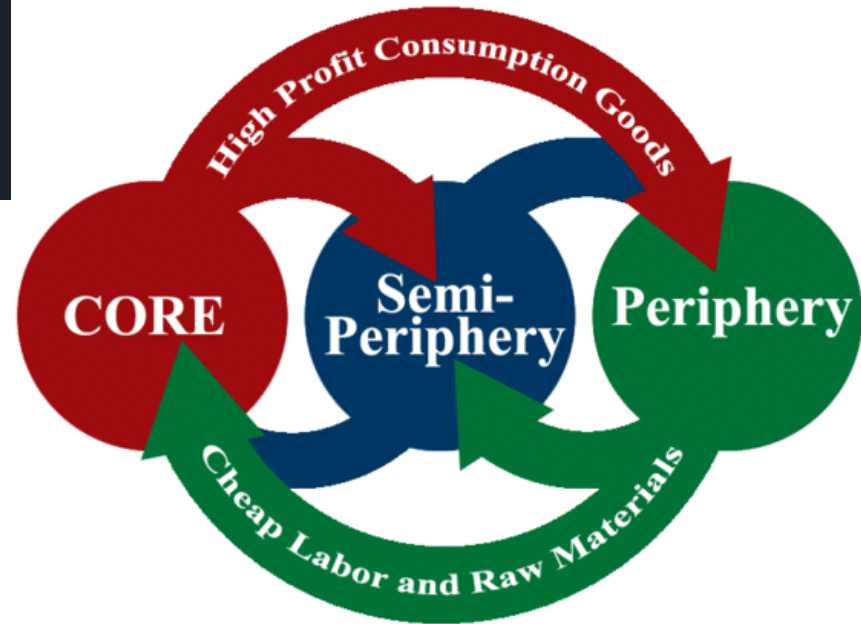

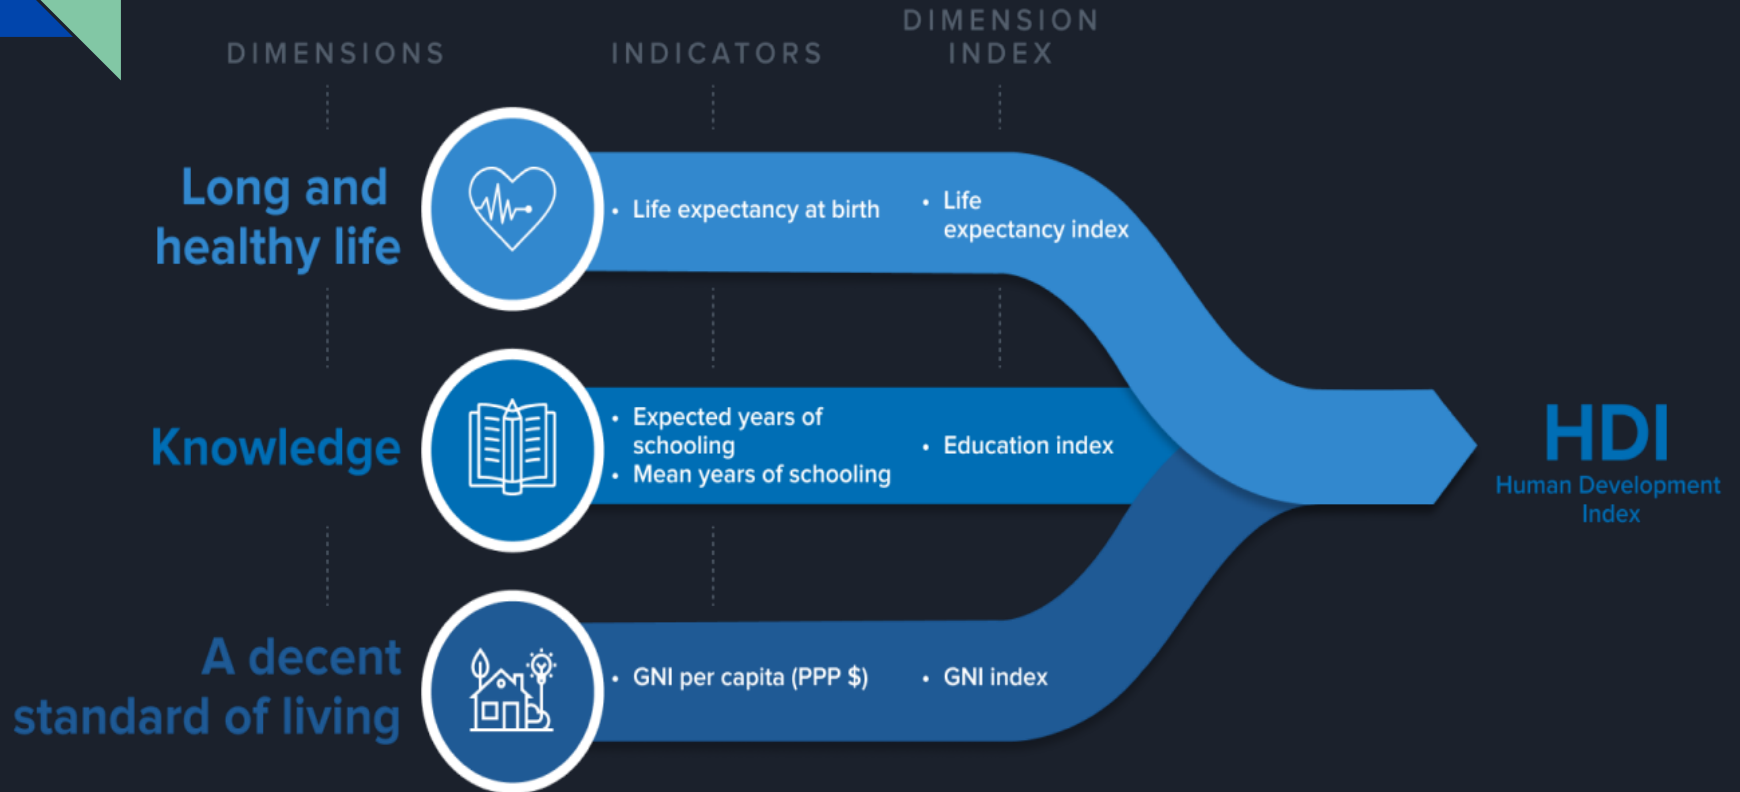

Figure 1: Rostow's Model of Development.

Wallerstein's World System Theory Model

HDI Review

Applying Development Theories to Country Specific Data

Directions: You will research HDI and other measures / descriptions of development for an assigned country. Based on your research findings, you will categorize your country within Rostow's Modernization Theory and Wallerstein's World System Theory. You will also make predictions and recommendations about future development and note relevant limitations of theories. Be sure to reference your guided notes from previous classes to aid you in your work.

Project Parts	Rubric Point Values
Part I: HDI Research	32 Points
Part II: CIA Research	24 Points
Part III & IV: Theory Application	24 Points
Part V: Predictions, Recs, Limits	20 Points

Country Assignments: See Country [List](#)

Match country number to your assigned number to identify the country you are to research.
