

Name: _____

Period: _____

Population Trends - The World Population Data Sheet at a Glance

Find answers to the following questions using the current *World Population Data Sheet* found in this assignment page in Schoology.

1. What is the current population of the world?

Rates are often used, instead of absolute numbers, to determine how frequently a population or demographic event is occurring — rates show how common an event is. Rates also make it possible to compare countries that vary greatly in terms of population size.

*The **crude birth rate** (CBR) is the annual number of births per 1,000 population.*

2. Which region has the highest CBR? Which region has the lowest?

*The **crude death rate** (CDR) is the annual number of deaths per 1,000 population.*

3. Which region has the highest CDR? Which region has the lowest?

*The **infant mortality rate** measures the number of deaths each year to infants under one year of age per 1,000 live births.*

4. Which region has the highest infant mortality rate and what is that rate? Which region has the lowest and what is that rate?

*The **total fertility rate** (TFR) is the average number of children a woman would have if she maintained today's level of childbearing throughout her reproductive years.*

5. Which region has the highest TFR and what is it? Which region has the lowest TFR and what is it?

The **age and sex structure** of a population refers to the number or proportion of males and females who are in each age category. Age-sex structure tells us about a population's past trends in fertility, mortality, and migration. It also provides information about the population's potential for future growth. The greater the proportion of people in the younger-adult age groups, the greater the potential for more births and population growth.

6. Which region has the "youngest" population (the highest proportion of population under age 15)? Which region has the "oldest" population (the highest proportion of population over age 64)?

7. In which region are people expected to live the longest? Which region has the lowest life expectancy? **For life expectancy, look at the total rather than male/female.**

A population grows because there are more births than deaths or more people are moving in than moving out. The difference between births and deaths is expressed as a percentage called the **rate of natural increase**.

8. Which region is growing the fastest through natural increase?

9. Which region is growing at the slowest rate?

Using the blank world map (below), shade/mark/star/circle the answers (regions) to the following questions:

- Question 4 - highest infant mortality rate – color red
- Question 7 – highest life expectancy – color blue
- Question 8 - fastest growing via natural increase - color green
- Question 9 – slowest NI rate - color yellow
