Unit 2: Population & Migration

Developing Understanding

BIG IDEA 1

Patterns and Spatial Organization **PSO**

- How does where and how people live impact global cultural, political, and economic patterns?

BIG IDEA 2

Impacts and Interactions **IMP**

- How does the interplay of environmental, economic, cultural, and political factors influence changes in population?

BIG IDEA 3

Spatial Patterns and Societal Change **SPS**

- How do changes in population affect a place's economy, culture, and politics?

This unit addresses the patterns associated with human populations. Populations may increase or decrease as a result of a combination of natural changes (births and deaths) and migration patterns (emigration and immigration). Students examine population distributions at different scales—local, national, regional, and global. Population pyramids demonstrate age-sex structures, revealing the growth or decline of generations and allowing geographers to predict economic needs based on reproductive and aging patterns.

Students learn about factors that influence changes in population as well as the long- and short-term effects of those population changes on a place's economy, culture, and politics. For example, environmental degradation and natural hazards may prompt population redistribution at various scales, which in turn creates new pressures on the environment and on cultural, economic, and political institutions. The study of migration patterns allows students to examine factors contributing to voluntary and forced relocation and the impact of these migrating populations on existing settlements.

Combined, the concepts and theories encountered in this unit help students develop connections and transfer their learning in upcoming units to course topics such as cultural patterns, the political organization of space, food production issues, natural resource use, and urban systems.

Unit 2: Population & Migration

Topic	Learning Objective	Essential Knowledge
2.1 Population Distribution	Identify the factors that influence the distribution of human populations at different scales. Define methods geographers use to calculate population density. Explain the differences between and the impact of methods used to calculate population density	Physical factors (e.g., climate, landforms, water bodies) and human factors (e.g., culture, economics, history, politics) influence the distribution of population. Factors that illustrate patterns of population distribution vary according to the scale of analysis. The three methods for calculating population density are arithmetic, physiological, and agricultural. The method used to calculate population density reveals different information about the pressure the population exerts on the land.
2.2 Consequences of Population Distribution	Explain how population distribution and density affect society and the environment.	Population distribution and density affect political, economic, and social processes, including the provision of services such as medical care. Population distribution and density affect the environment and natural resources; this is known as carrying capacity
2.3 Population Composition	Describe elements of population composition used by geographers. Explain ways that geographers depict and analyze population composition.	Patterns of age structure and sex ratio vary across different regions and may be mapped and analyzed at different scales. Population pyramids are used to assess population growth and decline and to predict markets for goods and services.
2.4 Population Dynamics	Explain factors that account for contemporary and historical trends in population growth and decline.	Demographic factors that determine a population's growth and decline are fertility, mortality, and migration. Geographers use the rate of natural increase and population-doubling time to explain population growth and decline. Social, cultural, political, and economic factors influence fertility, mortality, and migration rates.
2.5 The Demographic Transition Model	Explain theories of population growth and decline.	The demographic transition model can be used to explain population change over time. The epidemiological transition explains causes of changing death rates.

AP HuG

Unit 2: Population & Migration

Topic	Learning Objective	Essential Knowledge
2.6 Malthusian Theory	Explain theories of population growth and decline.	Malthusian theory and its critiques are used to analyze population change and its consequences.
2.7 Population Policies	Explain the intent and effects of various population and immigration policies on population size and composition.	Types of population policies include those that promote or discourage population growth, such as pronatalist, antinatalist, and immigration policies.
2.8 Women & Demographic Change	Explain how the changing role of females has demographic consequences in different parts of the world.	Changing social values and access to education, employment, health care, and contraception have reduced fertility rates in most parts of the world. Changing social, economic, and political roles for females have influenced patterns of fertility, mortality, and migration, as illustrated by Ravenstein's laws of migration.
2.9 Aging Populations	Explain the causes and consequences of an aging population.	Population aging is determined by birth and death rates and life expectancy. An aging population has political, social, and economic consequences, including the dependency ratio.
2.10 Causes of Migration	Explain how different causal factors encourage migration.	Migration is commonly divided into push factors and pull factors. Push/pull factors and intervening opportunities/obstacles can be cultural, demographic, economic, environmental, or political.
2.11 Forced & Voluntary Migration	Describe types of forced and voluntary migration.	Forced migrations include slavery and events that produce refugees, internally displaced persons, and asylum seekers. Types of voluntary migrations include transnational, transhumance, internal, chain, step, guest worker, and rural-to-urban.
2.12 Effects of Migration	Explain historical and contemporary geographic effects of migration.	Migration has political, economic, and cultural effects.

Chapter 2: Population & Health Unit 2: Population & Migration	Name: _____ Class: _____ Period: _____ Date: _____
Questions/Main Ideas:	Notes/Answers:
Field Note (pg. 29 & 30)	
Define infrastructure and give three examples.	
Describe Shanghai's metro system.	

Key Q #1: Where in the world do people live and why? (pg. 31 - 36)	
What is the population density of the United States? How does it compare to Bangladesh and the Netherlands?	
How can the arithmetic population density be misleading?	
How does the arithmetic population density compare to physiologic density?	
Based on the map on page 33, what regions of the world do most people live?	

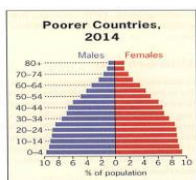

How do physical barriers affect the population distribution in South Asia? Give an example.	
Explain the causes of Europe's population distribution.	

Key Q #2: Why do populations rise and fall in particular places? (pg. 36 - 46)	
Describe the Malthusian theory and why it is wrong.	
How do you calculate natural increase? What does it mean if a country's natural increase is high? Which world regions have a high natural increase rate? Which world regions have a low natural increase rate?	
Identify and explain the TFR replacement level. What regions of the world have a TFR above the replacement level? What regions of the world have a TFR below the replacement level?	
What was the worldwide TFR in 2013?	

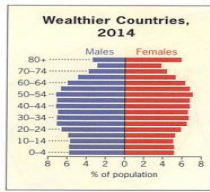

How do you calculate doubling time?	
About how many people are being added to the world population each year?	
What are some things India's government is doing to lower their TFR?	
Describe the birth and death rate trends in each stage of the demographic transition model using Figure 2.15.	Stage 1: Stage 2: Stage 3: Stage 4: Stage 5:
Using pages 44 & 45, explain an event England went through for stages 1 & 2 of the demographic transition.	
What cultural attitude shift occurred which caused a decline in birth rates? What stage is this?	

Key Q #3: Why does population composition matter? (pg. 46 - 47)

Why is it important to know the population composition of a country?	
What do population pyramids display?	
Describe what the shape this population pyramid means.	

Describe what the shape this population pyramid means.

Key Q #4: How does the geography of health influence population dynamics? (pg. 47 - 56)

How does infant and child mortality reflect the overall health of a society?

Which country has the lowest IMR?

What four countries have an IMR of 100 or more?

Describe the trends you see on the map:

Figure 2.18

- Title of map:
- Trend:

Figure 2.19

- Title of map:
- Trend:

Figure 2.20

- Title of map:
- Trend:

Figure 2.21

- Title of map:
- Trend:

Key Q #5: How do governments impact population change? (pg. 56 - 58)

Describe each population policy and give a real world example of where each has been used.

- Expansive:
- Restrictive:
- Eugenic:

Chapter 3: Migration Unit 2: Population & Migration	Name: _____ Class: _____ Period: _____ Date: _____
Questions/Main Ideas:	Notes/Answers:
Field Note (pg. 60 - 63)	
Why did Indians move from rural areas to cities in the 1970s?	
Define remittances. Give three examples from different countries.	
How many immigrants in the US are documented? How do they affect the economy?	

Key Q #1: What is migration? (pg. 63 - 66)	
Define emigration Define immigration	
What is the difference between cyclic and periodic movement?	
Compare international and internal migration. (address similarities & differences)	

Key Q #2: Why do people migrate? (pg. 66 - 73)	
How can migration be both forced and voluntary? Use Ireland as an example.	

What pattern(s) has emerged in studies of gender and migration?	
Summarize the examples of forced migration. Include the origin, final destination, statistics, and effects. Include two other examples of forced migration.	• Atlantic Slave Trade: • Human Trafficking:
Who was Ernst Ravenstein? List his laws of migration.	
Describe the gravity model. Is the model still relevant today?	
How is distance decay related to pull factors?	
Include multiple examples for the following push and pull factors.	• Legal status: • Economic conditions:

Include multiple examples for the following push and pull factors.	• Power relationships: • Political circumstances: • Armed conflict/civil war: • Environmental conditions: • Culture/traditions: • Technological advances:
--	--

Key Q #3: Where do people migrate? (pg. 73 - 86)	
What are the five major flows of global migration from 1500?	
Describe the following migrations:	• British/Ireland to Africa/Australia • Africa to Americas • India
Define guest workers.	

What occupations do most guest workers hold? What are some disadvantages to being a guest worker?	
Define <i>islands of development</i> and explain how it influenced the region of West Africa.	
How did European colonialism impact migration in Southeast Asia?	
Describe the migration stream of Jewish immigrants to Israel. How has the Israel-Palestine border changed over time?	
Explain the where and why of internal migration in:	• United States • Russia • Mexico
How many people were refugees in 1970? In 1980? In 2013?	
What is the 1951 Refugee Convention's definition of a refugee?	

Identify the significant facts, figures, countries involved, and characteristics of each region of dislocation.	• North Africa/Southwest Asia: • Africa: • South Asia: • Southeast Asia: • Europe:
---	--

Key Q #4: How do governments affect migration? (pg. 86 - 88)	
Describe the different waves of immigration in the US?	
How did 9/11 affect immigration policy?
