

Day 21, Unit 2, October 16 & 17

Agenda:

1. Class Expectations
2. Review DTM
3. 2.6 Malthusian Theory

Objective: Explain theories of population growth and decline.

New Nine Weeks - Higher Expectations

If you ask questions about due dates, when are tutorials, I will no longer answer.

- By now, you know the rhythm of this class and where this information can be found.
 - Schoology Homepage
 - Tutorial Times
 - Important Unit Dates

Will no longer remind you of late work/make up work policies.

- Review the Syllabus and Expectations (your own copy or electronic copy in Schoology General Info Folder) for late work, make up work policies. You signed this showing you have read it!

Absent: Don't ask what we did. Go to Schoology and the Teal/Blue bin on the table. After reviewing everything, if you still have questions, ask.

Final Reminders of our policies:

- 1) Pre-planned absence on the day a Reading Guide or Project is due
 - a) Still due by the original due date and time
 - b) Reach out to me to plan a way to submit early or by other means - this is your responsibility!
- 2) Unexcused absences (especially for just our class period) will be closely scrutinized when Reading Guides or Projects are due!
 - a) Truancy to avoid a due date will result in a late grade and potentially a referral!
- 3) Cell Phones are always to be put in Caddy at the beginning of the period. Failure to do so will longer result in a warning but confiscation (office, fine).
- 4) Hard deadlines will be enforced.
- 5) Make Up Work: # of days absence plus one block.

Review DTM Game

Warm Up: Are you a Neo-Malthusian?

1. What score did you receive?
2. Do you think your results are accurate in comparison to your beliefs?

Read the
“*Overview of
Theories*” and take
notes in space
provided on guided
notes worksheet

20:00

Thomas Malthus

- Born in 1766 in Surrey, England
- Educated at Cambridge University
- Professor of history and political economy
- Most famous for population theory proposed in:
- “An Essay on the Principle of Population” 1798
- Population was at 9 million - is his theory still relevant today?

Thomas Malthus, Essay on Population (1798)

- Social good measured by the well-being of the people, including the working classes/poor
- Poverty was the natural consequence of population growth
- Malthus's "law" of population: population grows **geometrically (exponentially)**; food and resources grow **arithmetically**

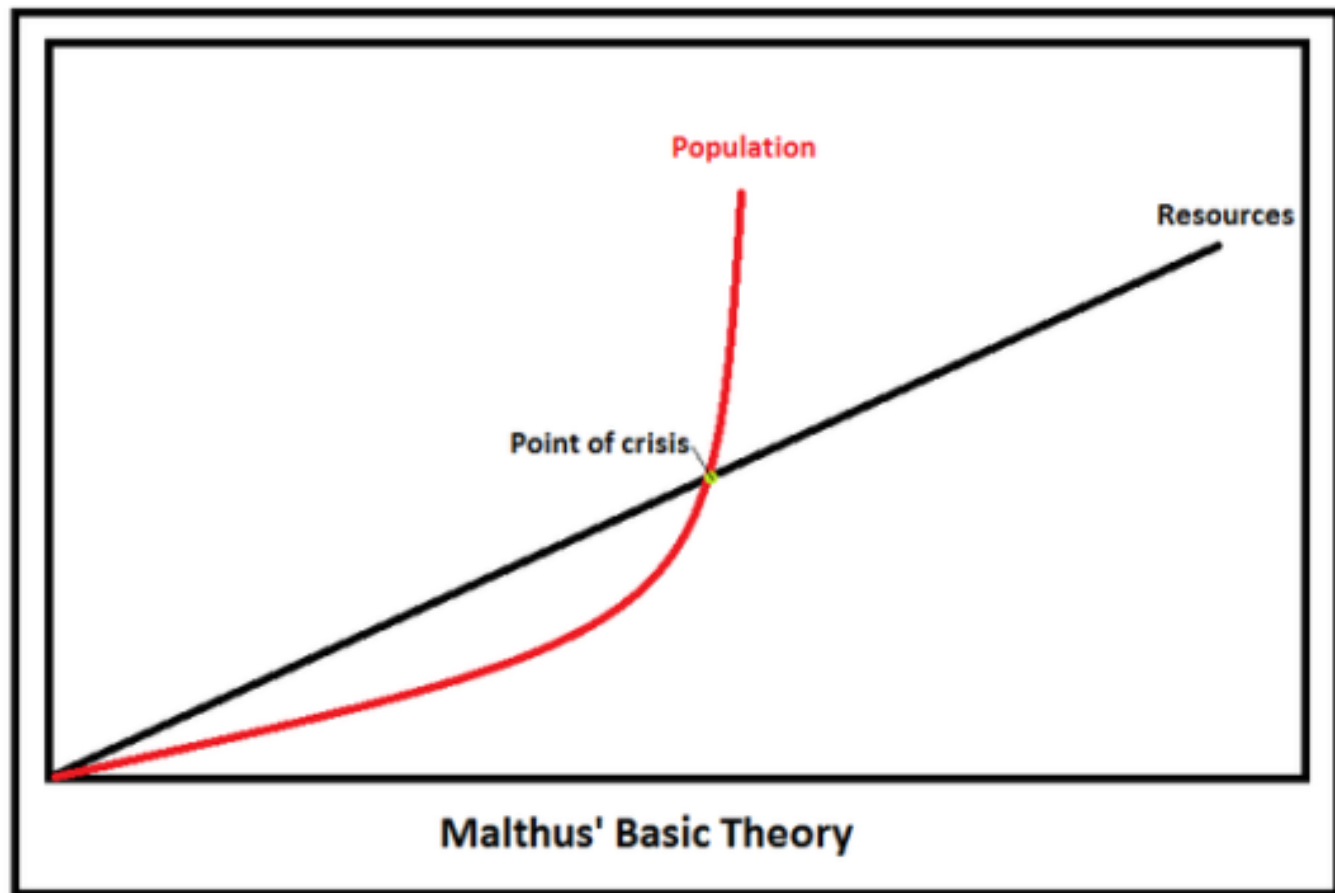

Malthusian Model

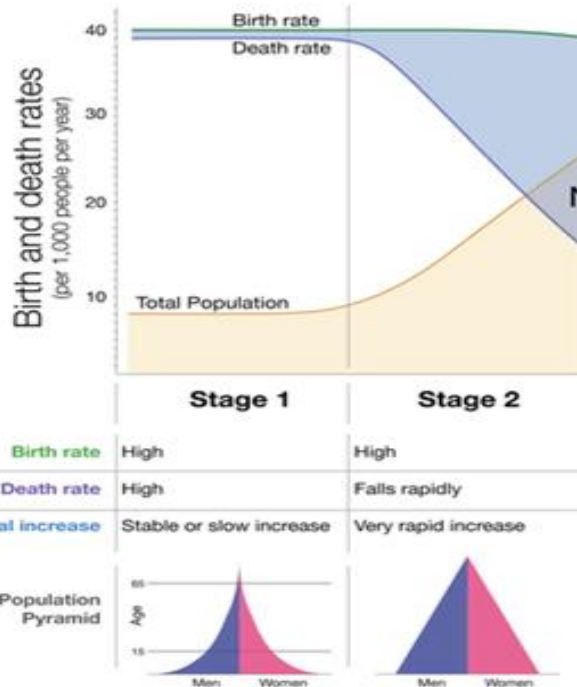

- Food is the primary resource; food scarcity increases mortality, reduces population
- Productivity gains from innovation cancelled out by more pop growth
- As population increases, food prices rise (excess demand of food), wages fall (excess supply of workers), mortality increases

Checks to Population

- Positive checks– anything that increases mortality (war, disease, famine, poor living standards) and kills off excess population
- Preventive checks- anything that limits birth rate [abstinence, delayed marriage and non-marriage (“moral restraint”)]
- Preventive checks superior (less human misery) but probably unattainable (due to human weakness)

Reflection of the Time

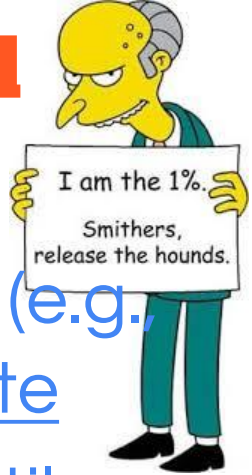

The author Max Roser licensed this visualisation under a CC BY-SA license. You find it

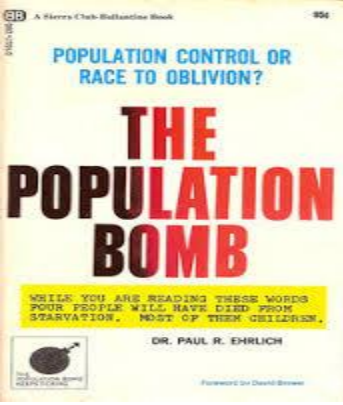

- End of 18th c: population was increasing, wages were falling
- Assumes primarily agricultural society with limited technological innovation (at the cusp of the Industrial Revolution), where laborers spent most income on food (bread)

STAGE TWO OF THE DTM

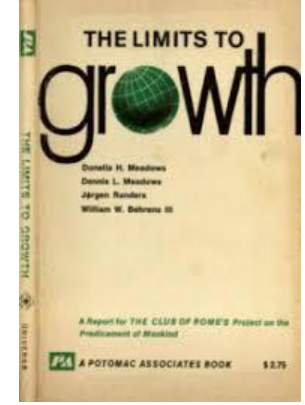

Malthus's theory became standard argument against social reforms

- Anything that raises the income of the poor (e.g. poor law payments) would raise the birth rate
- Number of the poor would then increase until there were so many that incomes would fall and mortality would increase
- Hence, it's impossible to raise the income of the poor; don't try
- This argument was very popular with the wealthy

Neo-Malthusians

- Neo-Malthusians: Adopt Malthus's pessimistic perspective about overpopulation
- Popular between the 1940s and 1960s
 - The Population Bomb
 - Limits to Growth
- Rapid growth would be checked by limited resources → unsustainable development
- Irreversible damage to the environment
- Working class' high birth rate is the problem
- Stress birth control methods - "family planning"

Example of Current Organization that somewhat aligns with Neo Malthusian Perspective

Discussion Question

Do you think Malthus' theory is still applicable today? Why or why not?
